## MEASUREMENT OF THE FOCAL LENGTH OF A CONCAVE MIRROR

## Apparatus

Concave mirror, screen, lamp-box with crosswire.

## Procedure

1. Place the lamp-box well outside the approximate focal length - see notes.
2. Move the screen until a clear inverted image of the crosswire is obtained.
3. Measure the distance $u$ from the crosswire to the mirror, using the metre stick.
4. Measure the distance $v$ from the screen to the mirror.
5. Calculate the focal length of the mirror using $\frac{1}{f}=\frac{1}{u}+\frac{1}{v}$.
6. Repeat this procedure for different values of $u$.
7. Calculate $f$ each time and then find an average value.

## Results

| $u / \mathrm{cm}$ | $\frac{1}{u} / \mathrm{cm}^{-1}$ | $v / \mathrm{cm}$ | $\frac{1}{v} / \mathrm{cm}^{-1}$ | $\frac{1}{f} / \mathrm{cm}^{-1}$ | $f / \mathrm{cm}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |

|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

Average $f=$

## Notes

The approximate method for finding the focal length is recommended as a starting point for this experiment. The approximate method is described in the Appendix.

A microscope lamp makes a very suitable strong light source. Cover the glass of the lamp with a piece of tracing paper. Use 'peel-and-stick' letters to create an 'object' on the tracing paper.
