(a) A motoring magazine collected data on cars on a particular stretch of road. Certain details on 800 cars were recorded.
(i) The ages of the 800 cars were recorded. 174 of them were new (less than 1 year old). Find the $95 \%$ confidence interval for the proportion of new cars on this road. Give your answer correct to 4 significant figures.

(ii) The data on the speeds of these 800 vehicles is normally distributed with an average speed of 87.3 km per hour and a standard deviation of 12 km per hour.
What proportion of cars on this stretch of road would you expect to find travelling at over 95 km per hour?

(b) (i) A road safety programme was carried out in the area using posters, signs and radio slots. After the programme the motoring magazine recorded the speeds of 100 passing cars. The magazine carried out a hypothesis test, at the $5 \%$ level of significance, to determine whether the average speed had changed.
The $p$-value of the test was 0.024 .
What can the magazine conclude based on this $p$-value?
Give a reason for your answer.

(ii) The magazine found that the average speed of this sample was lower than the previously established average speed of 87.3 km per hour.
Find the average speed of the cars in this sample, correct to 1 decimal place.
